## 1 About this document

Please read this chapter carefully before beginning to use the telegram listing.

The document shows how to send telegrams via a terminal program using the SICK protocol CoLa A (ASCII and hexadecimal values, with TCP port 2111 or 2112) or CoLa B (binary/hexadecimal values,*Currently Under Preparation*) to RMS320. This comprises the query of the current device state or certain parameter values, how to modify parameter values and the way in which the device confirms or responds to commands/telegrams.

The devices generally support automatic IP address discovery. Default IP address is:

- RMS320: 192.168.0.1

Subnet mask is 255.255.255.0.

IP ports:

- 2111: CoLa A (fixed)
- 2112: CoLa A (can be switched to CoLa B)

Most parameter changes also require certain user levels. Additionally, commands may change during the product lifecycle and development process with a new firmware.

This telegram listing is based on the following firmware statuses (or newer):

- RMS320(V1.0.0)

If commands do not seem to work, please verify that your device version supports this functionality, that the minimum required user level has been selected and check on updates of this documentation.

## 2 Communication format

### 2.1 Binary telegram (CoLa B, Currently Under Preparation)

The binary telegram is the basic protocol of the scanner (CoLa B). All values are in hexadecimal code and grouped into pairs of two digits (= 1 byte). The string consists of four parts: header, data length, data and checksum (CS).

The header indicates with  $4 \times \text{STX}$  (02 02 02 02) the start of the telegram.

The data length defines the size of the data part (command part) by indicating the number of digit pairs in the third part. The size of the data length itself is 4 bytes, which means that the data part might have a maximum of  $16^8 = 4,294,967,295$  digit pairs.

The data part comprises the actual command with letters and characters converted to Hex (according to the ASCII chart) and the parameters of either decimal numbers converted to Hex or fixed Hex values with a specific, intrinsic meaning (no conversion). There is always a blank (20) between the command and the parameters, but not between the different parameter values.

The checksum finally serves to verify that the telegram has been transferred correctly. The length of the checksum is 1 byte, CRC8. It is calculated with XOR.

#### Example: Binary telegram

|             |             |  |    |
|-------------|-------------|--|----|
| 02 02 02 02 | 00 00 00 17 | 73 4D 4E 20 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 03 F4 72 47 44 | B3 |
| Header      | Length      | Data   | CS |

Table 1: Example: Binary telegram

This is an example telegram for setting the user level “Authorized Client”:

- Header = 02 02 02 02
- Length = 23 digit pairs (17h)
- Data:
  - 73 4D 4E 20 = sMN = start of Sopas command (and blank)
  - 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 = Set Access Mode = the actual command for setting the user level (and blank)
  - 03 = fixed Hex value meaning user level “Authorized Client”
  - F4 72 47 44 = fixed Hex value, serving as password for the selected user level “Authorized Client”
- Checksum = B3 from XOR calculation

## 2.2 ASCII telegram (CoLa A)

The ASCII telegram is an alternative to the binary telegram. Due to the variable string length of ASCII telegrams, the Binary telegram is recommended when using scanners with a PLC.

The ASCII telegram has the advantage that commands can be written in plaintext. The string consists only of two parts: the framing and the data part.

The framing indicates with <STX> and <ETX> the start and stop of each telegram.

The data part comprises the actual command with letters and characters (plaintext), parameter values either in decimal (special indicator required) or in hexadecimal (example: a frequency of 25 Hz = +2500 (decimal) = 09C4 (Hex)) and fixed hexadecimal values with a specific, intrinsic meaning. As leading zeros are being deleted, there is always a blank required between all command parts and parameter parts.

### NOTE

**The device will confirm parameter values always in hexadecimal code, regardless of the code sent.**

As further alternative within CoLa A, depending on the preferences of the user, all values can be written directly in Hex. This means however a 1:1 conversion of all letters and characters including numbers and fixed hexadecimal values via the ASCII chart.

#### Example: ASCII telegram

|       |       |  |       |
|-------|-------|--|-------|
| ASCII | <STX> | sMN{SPC}SetAccessMode{SPC}03{SPC}F4724744  | <ETX> |
| Hex   | 02    | 73 4D 4E 20 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 30 33 20 46 34 37 32 34 37 34 34 | 03    |
|       | Start | Data   | Stop  |

Table 2: Example: ASCII telegram

This is again an example telegram for setting the user level “Authorized Client”. As only fixed hexadecimal parameter values are needed, the option to use parameter values in decimal code with special indicator cannot be applied here:

- Framing = <STX> = telegram start = 02 (Hex)
- Data:
  - sMN = start of Sopas command (and blank) = 73 4D 4E 20 (Hex)
  - SetAccessMode = the actual command for setting the user level (and blank) = 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 (Hex)
  - 03 = fixed Hex value meaning user level “Authorized Client” (and blank) = 30 33 20 (Hex)
  - F4 72 47 44 = fixed Hex value, serving as password for the selected user level “Authorized Client” = 46 34 37 32 34 37 34 34 (Hex)
- Framing = <ETX> = telegram stop = 03 (Hex)

## 2.3 Variable types

| Variable type | Length (byte)     | Value range  | Sign |
|---------------|-------------------|--|------|
| Bool_1        | 1                 | 0 or 1   | No   |
| Uint_8        | 1                 | 0 ... 255  | No   |
| Int_8         | 1                 | -128 ... +127  | Yes  |
| Uint_16       | 2                 | 0 ... 65,535   | No   |
| Int_16        | 2                 | -32,768 ... +32,767  | Yes  |
| Uint_32       | 4                 | 0 ... 4,294,967,295  | No   |
| Int_32        | 4                 | -2,147,483,648 ... +2,147,483,647  | Yes  |
| Enum_8        | 1                 | Certain values defined in a list of Choices (0 ... 255)  | No   |
| Enum_16       | 2                 | Certain values defined in a list of Choices (0 ... 65535)  | No   |
| String        | Context-dependent | Strings are not terminated in zeroes   |      |
| Real          |                   | Float nach IEEE754 (see <a href="http://www.h-schmidt.net/FloatConverter/IEEE754de.html">www.h-schmidt.net/FloatConverter/IEEE754de.html</a> ) |      |

Data length is always given in Bytes!

## 2.4 Command basics

| Description   | Value ASCII                     | Value Hex  | Value Binary               |
|---------------|---------------------------------|--|----------------------------|
| Start of text | <STX>                           | 02   | 02 02 02 02 + given length |
| End of text   | <ETX>                           | 03   | Calculated checksum        |
| Read          | sRN                             | 73 52 4E   |                            |
| Write         | sWN                             | 73 57 4E   |                            |
| Method        | sMN                             | 73 4D 4E   |                            |
| Event         | sEN                             | 73 45 4E   |                            |
| Answer        | sRA<br>sWA<br>sAN<br>sEA<br>sSN | 73 52 41<br>73 57 41<br>73 41 4E<br>73 45 41<br>73 53 4E |                            |
| Space         | {SPC}                           | 20   | 20                         |

If values are divided into two parts (e.g. measurement data), they are documented according to LSB 0 (e.g. 00 07), output however is according to MSB (e.g. 07 00).

**2.5 Log in: Required user level**

| Task   | Required user level |
|--|---------------------|
| Change sensor parameters   | Authorized Client   |
| Requests or queries<br>(e.g. for measurement data or device state) | None                |
| Manage password  | Service             |

### 3 Workflows

#### 3.1 Parameterize the devices

- 1 Log in: sMN SetAccessMode (see 4.1.1, page10)
- 2 Configure output data contents: sWN TransmitTargets(see4.2.1, page18) and/or sWN TransmitObjects(see4.2.2, page19)
- 3 Store parameters: sMN mEEwriteall (see 4.1.5, page 15)
- 4 Log out: sMN Run (see 4.1.6, page 16)
- 5 Request scan:  
sEN LMDradardata (see 4.2.3, page 20)  
(Device output ...)

More detailed command descriptions can be found in the following part of this document.

## 4 Telegrams

### 4.1 Basic Settings

#### 4.1.1 Set Access Mode (Log in)

| Telegram structure: sMN SetAccessMode |  |          |        |        |  |   |
|---------------------------------------|--|----------|--------|--------|--|---|
| Telegram part                         | Description                            | Variable | Length | Sensor | Values CoLa A (ASCII)  | Values CoLa B (Binary)  |
| Command type                          | Method                                 | String   | 3      | All    | sMN  | 73 4D 4E  |
| Command                               | User level                             | String   | 13     | All    | SetAccessMode  | 53 65 74 41 63 63 65 73<br>73 4D 6F 64 65   |
| User level                            | Select user level                      | Int_8    | 1      | All    | Maintenance: 02<br>Authorized client: 03<br>Service: 04                      | Maintenance: 02<br>Authorized client: 03<br>Service: 04                               |
